

Wordle Assignment

AI Assistant Chat History

Student: Mohammed Shahid Javed Mokashi

Repository: [PES1UG24AM378/17_wordle](#)

Assignment: Lab 4 — VibeCoding

This document is a formatted summary of the chat history provided for the assignment. It is not a verbatim export of the original conversation; it preserves the supplied sequence of tasks, reported changes, and troubleshooting steps.

1. Initial Setup and Investigation

User:

run this project

AI Assistant (summary):

The project directory was inspected, including README.md and requirements.txt. The project was identified as a Wordle clone with four tasks: fix duplicate-letter logic, add win/loss handling, support multiple word lengths, and add guess history. Initial fixes were made and instructions were provided to run the game with `py main.py`.

2. Reverting for Video Recording

User:

dont do changes just run the game

AI Assistant (summary):

After the code was reverted to the original broken state for the “before” video, the user encountered `ModuleNotFoundError: No module named 'feedback'`. The missing `feedback.py` file was recreated in its original, unmodified form, and the user was instructed to run the game in the terminal.

3. Resolving the Module-Not-Found Error

User:

The `ModuleNotFoundError` appeared again after running `cls`; the traceback was pasted.

AI Assistant (summary):

The `feedback.py` file appeared to have been deleted again. It was recreated again, and the user was told the unmodified game was ready for the “before” video.

4. Playing the Game

User:

how to play this game

AI Assistant (summary):

Simple instructions were provided: enter a five-letter word, press Enter, and interpret the green, yellow, and gray feedback.

5. Task Status Check

User:

read the readme file and check if how many task you have completed

AI Assistant (summary):

The four README tasks were summarized. Because the code had been reverted for the baseline recording, the active codebase was reported as having zero of the four tasks completed at that point. Reapplying the fixes was offered.

6. Implementing Task 1 and GitHub Push Attempt

User:

task 1 is done push it github — https://github.com/PES1UG24AM378/17_wordle

AI Assistant (summary):

feedback.py was edited to fix duplicate-letter counting. A push attempt failed with HTTP 403 because Git was authenticated as shahidmokashi143-ai, which did not have permission to push to the target repository.

7. Fixing GitHub Credentials

User:

this is my user name PES1UG24AM378

AI Assistant (summary):

Instructions were provided to remove the saved GitHub credential from Windows Credential Manager and re-authenticate using an account with write access.

8. Implementing Task 2

User:

implement task 2

AI Assistant (summary):

The reported change in game.py was to use a loop that validates guesses and does not consume one of the six allowed turns for invalid input. The user reported that authentication was subsequently successful and Task 1 was pushed; Task 2 was then committed and pushed.

9. Implementing Tasks 3 and 4

User:

yes do similar to all tasks

AI Assistant (summary):

Task 3: 4-letter and 6-letter word options were added to words.py, and main.py was updated to prompt for word length. Task 4: game.py was updated to print guess history after each turn and a final Session Summary. The supplied history states that these changes were committed and pushed.

10. Recording the After Video

User:

how to make the after video after all the changes are made

AI Assistant (summary):

A recording sequence was provided to demonstrate the variable-length modes, duplicate-letter feedback, invalid guesses not consuming turns, guess history, and the final Session Summary.

11. Exporting Chat History

User:

this over all chat history do a pdf in the repo

AI Assistant (summary):

Instructions were given to use Ctrl+P and Print to PDF, or copy the chat into a document and export it as a PDF.

12. Context Summary

User:

give me entire context of all things in this chat

AI Assistant (summary):

A Markdown summary of the conversation was prepared from the details supplied by the user.

13. Git Push Permission Troubleshooting

User:

git push origin main returned a 403 Permission denied error for PES1UG24AM378/17_wordle

AI Assistant (summary):

The error was explained as an authentication/permission issue. The user was advised to inspect git remote -v, verify the repository owner and write access, and update the remote URL only if the actual destination repository was different.

14. Commands for Cloning and Pushing

User:

command to clone the repo; command to push each task after completion to the github

AI Assistant (summary):

Clone command: `git clone https://github.com/SETAPESU26/17_wordle.git`. For each task, check git status, stage the intended changes, commit with a task-specific message, and push to the branch in the student repository. The push target must be a repository where the authenticated account has write permission.

15. Demonstrating the Four Wordle Tasks

User:

Asked how to record a seamless after-changes video.

AI Assistant (summary):

A continuous demonstration was planned: launch with `py main.py`; choose a supported word length; show repeated-letter feedback; submit invalid input and confirm attempts are not consumed; finish the game to show per-guess history and Session Summary. The handout requires a 10-second before and 10-second after video.

16. Sample Gameplay During Testing

User:

For a 4-letter game, entered SLAT, CHAT, and GOAT and reported feedback.

AI Assistant (summary):

The clues were interpreted as a pattern ending in OAT after the GOAT feedback. A follow-up guess was suggested. This gameplay exchange was part of testing the updated game.

Submission reminder: place the before and after videos, updated source code, and this exported chat-history PDF under the Lab-4 folder of the lab submission repository, following the instructor's instructions. Keep separate Git commits for each task and do not open a pull request against the original SETAPESU26 repository.
